

Resource Manifest

This manifest maps the repository contents. The concrete experiment designs are the root documents. The source papers and articles live under **reference/**.

Lab Instructions

- `project-brief.md`
Short project framing, claim boundaries, and student deliverables.
- `build-01-piezo-crystal-plate-pendulum.md`
Primary student build. Use this for the low-voltage plate, self-read schedule, pendulum force measurement, dummy, sham, sign reversal, and physical flip controls.
- `build-02-acoustic-cymbal-hoverboard-bench.md`
Larger bench build. Use the single-dish calibration station before the four-dish platform.
- `controls-and-data-protocol.md`
Shared control logic, artifact rejection, run naming, and data protocol.
- Run manifest template and data columns template
Fixed logging templates for each run.

Compiled versions of the lab instructions live in `pdf/`.

Included Build Background

- Hacking the Simulation PDF
Self-reading PoC logic, plate build, pendulum or balance protocol, dummy design, and artifact controls.
- Antigravity Devices HTML
Claim boundaries across conventional acoustic lift, ion-wind lift, refuted claims, and the open `chi_nu` hypothesis.
- DIY Hoverboard Cymbal PDF
Cymbal geometry and pot-lid precursor: four dishes, three transducers per dish, 60 percent radius placement, and phase-locked drive.
- Hover Disk HTML
Materials and coherent-substrate background.
- How To Build A UFO HTML and controlled-motion PDF
Broad architecture and motivation. Use as background after the lab plan.

Included Supplemental Theory

- OPH dark matter paper
- Compact OPH paper
- `chi_nu` susceptibility bounds paper

Public Links

- Blog article
- Public overview
- NotebookLM for questions
- TinyLev acoustic levitator paper
